

Raven Programmer

Power Connectors

Status LEDs

Configuration Switches

Engineers Note:
Design for a 68HC705e1 Programmer.
This is intended to program 68HC705e1 MCUs,
which should be a drop in replacement for
the 68HC705e1 - which in turn is used multiple
early 90s Macintoshes as the "EGRET" or "CUDA" controllers.

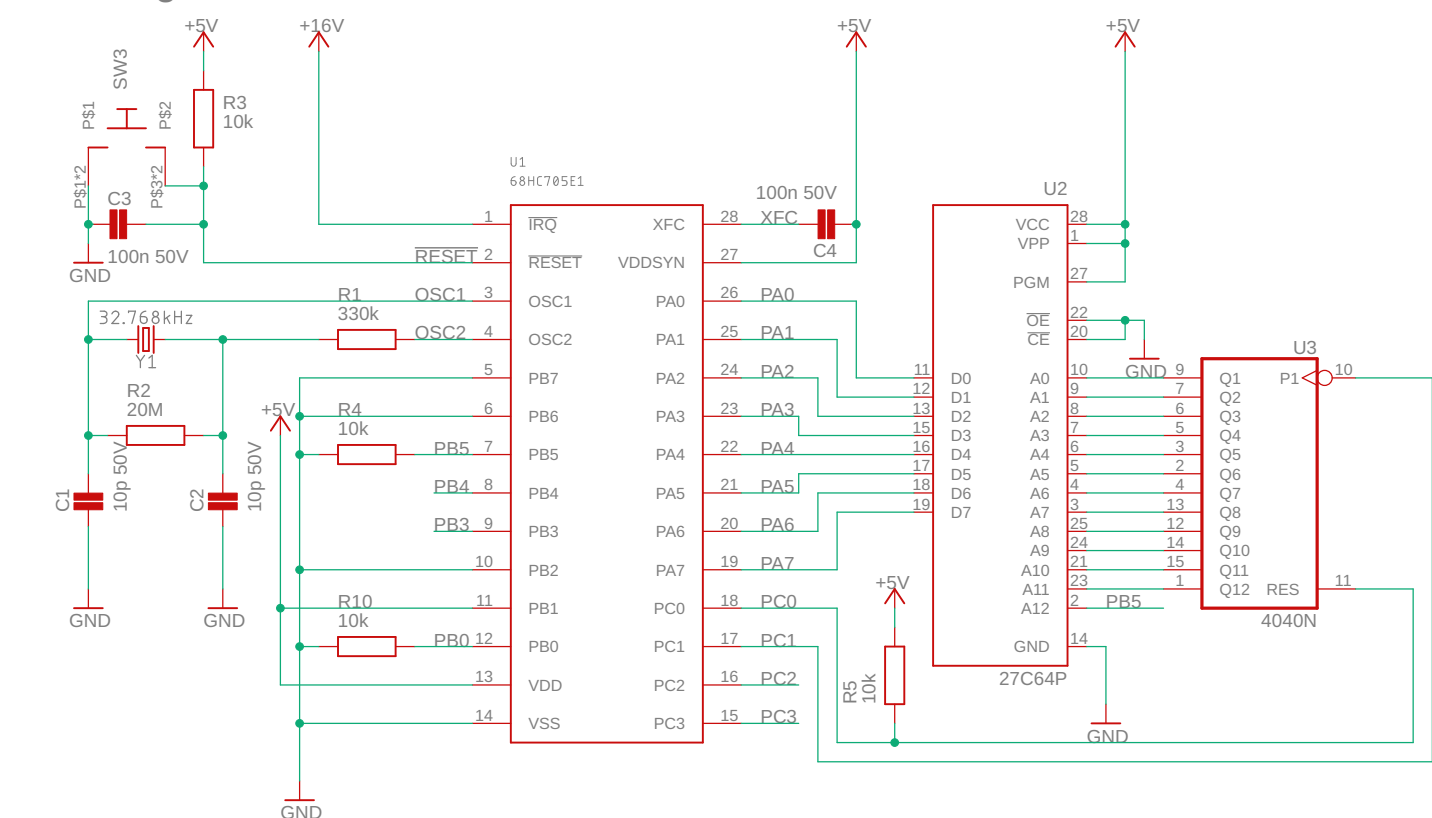

This will hopefully generate drop in replacements for the EGRET or CUDAs.

Design based off programming circuit found in the 68HC705e1 Datasheet.

Main Programmer

Engineers Note:
The Datasheet for the 68HC705e1 from NXP is dogshit. The programming circuit misses out that PB1 needs to be connected to VDD, and that PB7 and PB6 need to be connected to 0v. These changes were found and implemented after VDEV2. The better datasheet to use is the document MC68HC705E1TS/D, which will be distributed with this schematic.
